

Learn the truth

about Reynolon® PVC Shrink Film

Reynolon® Shrink Film, the industry leading PVC film used for over-wrapping retail products, is a responsible packaging choice. Here's why.

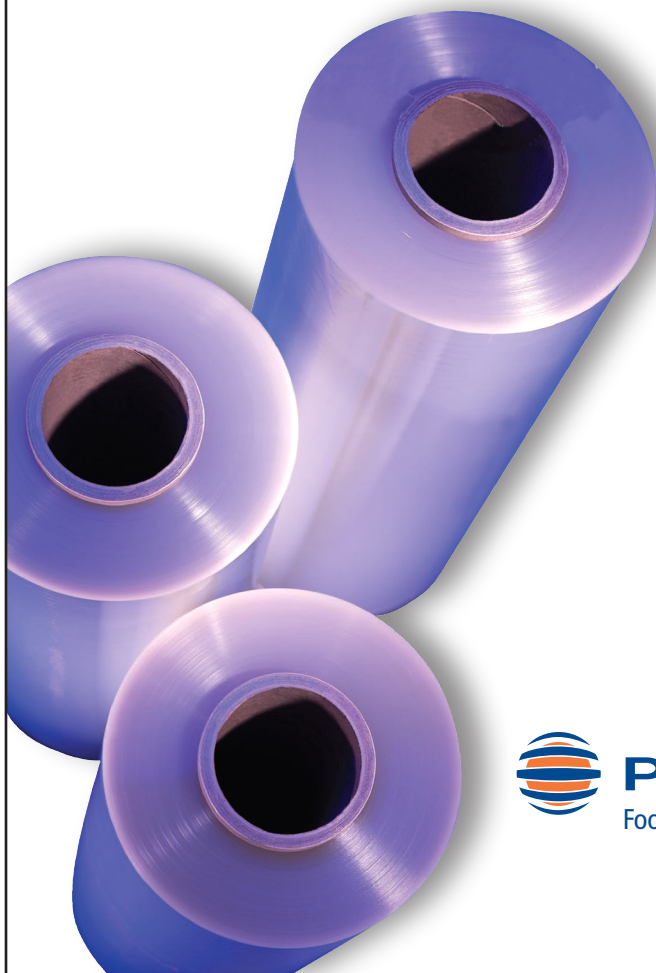

Reynolon® films are a safe packaging option. Our films are domestically manufactured and our operations comply with all OSHA and EPA regulations. We do not utilize cadmium or lead to manufacture PVC shrink film, nor do we utilize phthalates. In addition, Reynolon® Shrink Films approved for use in food packaging applications under FDA regulations are available.

Reynolon® Shrink Films are also a sustainable packaging option. Approximately 64%* of our raw materials come from bio-based, renewable or abundant resources, with only 36% coming from petroleum. This is possible because 57% of our main ingredient, PVC resin, comes from salt, a nearly inexhaustible resource. In addition, we use plasticizers derived from renewable resources such as soybean oil and tree oil.

When it comes to making choices about safe and sustainable packaging, don't discount the truth.
